

## Planning Your Bathroom Remodeling

The bathroom is one of the most personal as well as practical rooms in the house. Bathrooms are used to unwind after a hard day at work as well as to recharge and get ready for the upcoming day.

**Designing the perfect bathroom is a difficult task. Since it serves many purposes as well as many individuals at one, it is challenging to create the perfect atmosphere. The challenge lies in turning the smallest room in the house into a comfortable and lavish space.**

The key to creating a perfect bathroom is maximizing the available space. Always look for pockets of space that can be used to open up space and give the room extra dressing space.

Depending on the height and size of the bathroom and its users, vanities, cabinets, shelves, bath accessories as well as under sink storage can often be relocated higher or around a corner. This can help to free up counter space for grooming and makeup application, for example.

One way to free up space would be to move shelves higher up and store less used items such as spare towels and toiletries on them. Furthermore, choosing practical bath accessories will free up valuable countertop space as well.

When remodeling a bathroom, cost is always a limiting factor. However, there are two ways to maximize the money you spent.

One way is to select high quality products which will be used for a long period of time. The longer use will make the average cost per year the same as using cheaper materials that may not be as durable. Always be sure to check out internet retailers as they are able to offer better pricing as well as a wider variety of products.

If spending a lot of money initially is not an option, you may opt for lower quality products that can be replaced every few years. Always be sure all the fixtures and accessories are installed properly. Furtherer, avoid using glue for flooring and fixating accessories. Glue removal is time consuming and is a lot more costly that using nails or staples.

When it comes to installing a shower set, always be sure to choose a high quality set. You will want to find shower heads, knobs, and rough-in valves that are durable and will last a long time without leaking. Any shower leaks may lead to costly damages and repairs.

Furthermore, you will need to consider heating options. For the first time in decades electrical heating is more cost-effective than gas, especially for small, confined spaces

like bathrooms. If you're planning a floor tile replacement, now is a good time to install radiant under-floor heating.

There are several different under-floor heating styles available. Some consist of a thin sheet of material lined with wiring or mesh that connects to the electrical system of the house. They're safe to use, and they help to keep the tile floor warm as well as heat the entire bathroom for pennies per day.

Often bathroom remodeling projects can be done in different parts. For example, the floors one month, cabinetry the next, then showers or toilets, sinks or faucets and so forth. If you wish stay within the remodeling budget, always be sure to plan ahead and shop around for the highest quality products at the lowest possible price. With the right planning, you can create that personal space that will reflect your unique personality.
